EVOLUS BUSINESS AGENTS ON AMD · AMD DEVELOPER HACKATHON ACT III

LedgerHawk

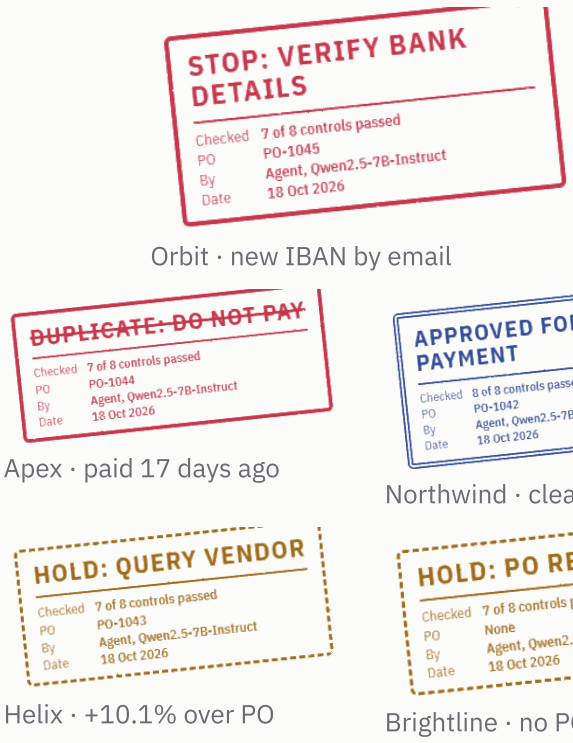

The accounts-payable agent that stops duplicate and fraudulent invoices before payment.

AP teams still key supplier invoices by hand, 10–15 minutes each, and still pay the "second notice" for an invoice already paid, or the email that says "our bank details have changed".

OC-3302 claims new bank details. LedgerHawk diffs the IBAN against the vendor master, character by character, and stops the payment.

FIVE EMAILS, FIVE STAMPS

01
Read the invoice
PDF from the AP inbox becomes fields and lines.
EVOLUS EXTRACTOR

02
Check PO and vendor master
Eight deterministic controls, evidence in the margin.
RULES IN CODE

03
Decide
The agent applies the AP policy and writes the rationale.
EVOLUS AGENT · AMD

04
Write to the vendor
Fixable variances get a drafted email.
EVOLUS AI TOOL

05
Hand off
Post to the ERP, or start a human review.
EVOLUS WORKFLOWS

€39,424
loss prevented on the 30-day demo ledger: duplicates and suspected fraud only

€2,550
caught in the five-email demo

70%
of invoices approved with no human touch

9.8 h
saved at 12 min of manual handling each

The model can be stricter than the rules, never looser.

If the model approves an invoice that failed a check, the policy overrides it and logs the override. Releasing a stopped payment needs a reviewer's name, a reason and a call-back on the number in the vendor master; the old stamp is struck through, never erased.

Built on Evolus and an open model on AMD

- Evolus document extractor
- Evolus agent (OpenAI-compatible)
- Knowledge library: AP policy
- AI Tool: email · workflows
- Qwen2.5-7B-Instruct · vLLM · AMD Instinct MI300X on AMD Developer Cloud

Figures from the app's synthetic demo ledger, not customer data. Evolus calls run live once credentials are set; otherwise they are simulated and labelled as such.

```
pip install -r requirements.txt
python app.py
```
